

Business Requirements Document

Digitization of Loan Documents & Safe In / Safe Out Process

1. Document Purpose

The purpose of this initiative is to digitize the existing manual process of maintaining loan documents and recording their movement into and out of the Documentation Vault.

Currently, document details and Safe in/Safe Out information are maintained in a physical register. The proposed solution will replace this register with a centralized digital module where users can maintain document details, scanned documents, physical storage location and movement history.

2. Existing Process

The customer submits the required loan and property documents to the branch.

The branch prepares the loan proposal in CRIMS and sends it to CAD for approval. After approval, the branch coordinates with CAD for further documentation and preparation of the legal paper.

The received documents are currently recorded manually in a register and stored in the Documentation Vault.

The manual register contains information such as:

- Account Number
- Safe In Date
- Document Details
- Custodian Initials
- Safe Out Date
- Safe Out Purpose
- Recipient Signature

The documents include:

- Charge Documents
- Security Documents
- Property Documents
- Other Ancillary Documents

Documents remain in the vault until the loan is settled or paid off.

3. Problem Statement

The system should allow users to search the account and view all documents associated with it.

The current process has the following limitations:

- Manual maintenance of document records.
- Dependency on physical registers for Safe In/Safe Out tracking.
- Limited centralized visibility of document information.
- Manual identification of physical document location.
- Difficulty in searching and retrieving historical document information.
- Manual tracking of documents taken out of the vault.
- Increased risk of incomplete or inconsistent register entries.
- Limited digital auditability of document movement.
- Additional effort required to locate relevant customer and document records.

4. Proposed Process

A digital module will be introduced to maintain the loan document record and replace the manual register.

The basic process will be:

Account Selected → Documents Added → Document Details Maintained → Physical Location Recorded → Safe In → Document Stored → Safe Out when Required → Document Returned / Safe In

The system should allow users to search the account and view all documents associated with it.

5. Functional Requirement

5.1. Customer Record

The system should allow users to search/select an account and view the documents maintained against that account.

The unique ticket number against each entry should be used to link the documents with the relevant loan account.

5.2. Document Record

For each document, the system should allow the user to record:

Field	Description
Account Number	Relevant customer/loan account
Document Category	Charge / Security / Property / Ancillary
Document Name	Name/details of document
Status	Pending / Received
Signee	Relevant signee
Expiry Date	Expiry date, where applicable
Approval Status	Current approval status
Scanned Document	Upload/view scanned document

5.3. Safe In

The system should allow the authorized user to record when a physical document is placed in the Documentation Vault.

The following information should be captured:

Field	Description
Safe In Date	Date document is placed in vault
Custodian	Person responsible for the document
CAD Region	Relevant CAD region
Cabinet	Cabinet where document is stored
Folder/Reference No.	Physical folder/reference number

After Safe In, the document should be shown as currently available in the vault.

5.4. Safe Out

When a document is taken out of the vault, the user should be able to record the Safe Out transaction.

The following information should be captured:

Field	Description
Safe Out Date	Date document is taken out
Purpose	Reason for taking out document
Recipient	Person receiving the document
Custodian	Relevant custodian
Recipient Signature	Acknowledgement/signature
Safe Out Date	Date document is taken out

The Safe Out details should be linked to the relevant document and retained in the system. The existing manual register already captures Safe Out Date, Purpose and Recipient Signature.

5.5. Document Return

When a document taken out of the vault is returned, the user should be able to record the document back into the vault through the Safe In process.

The system should update the document's current status and physical location while retaining the previous Safe Out record.

6. Search & View

Users should be able to search for documents using the Loan number.

After selecting the loan account, the system should display all documents linked to that account.

The user should be able to view:

- Document Name
- Document Category
- Document Status
- Signee
- Expiry Date
- Approval Status
- Current Safe In/Safe Out status
- Current physical location
- Safe In/Safe Out history
- Scanned document, where available

The system should also allow users to easily search and retrieve document records.

7. Basic Controls

The system should ensure that:

- Only authorized users can add or update document records.
- Safe In/Safe Out can only be performed by authorized users.
- A document already marked as Safe Out should not be issued again until it is returned.
- The current physical location of the document is visible.
- Previous Safe In/Safe Out transactions are retained for tracking.
- User activity is recorded against transactions.

8. User Roles and Access Matrix

The system should support role-based access control to ensure that document records and Safe In/Safe Out transactions are maintained and approved only by authorized users.

The following roles are defined within the system:

Role	Description
CAD Maker / Custodian	Adds and updates document records, uploads scanned documents, and performs Safe In and Safe Out transactions.
CAD Checker / Authorizer	Reviews and approves document records and Safe In/Safe Out transactions recorded by the Maker.
CAD Admin	Manages system configuration, user access rights, and master data such as CAD regions and cabinets.
Viewer	Read-only access to document details and Safe In/Safe Out movement history for monitoring and audit purposes.

The access matrix below defines the permissions applicable to each role:

Function	CAD Maker / Custodian	CAD Checker / Authorizer	CAD Admin	Viewer
Search Account & View Documents	Full Access	Full Access	Full Access	View only
Add / Update Document Record	Full Access	View only	Full Access	No Access
Upload Scanned Document	Full Access	View only	Full Access	No Access
Safe In	Full Access	No Access	Full Access	No Access
Safe Out	Full Access	No Access	Full Access	No Access
Approve Safe In / Safe Out	No Access	Full Access	Full Access	No Access
View Document Movement History	Full Access	Full Access	Full Access	Full Access
Manage Users & System Configuration	No Access	No Access	Full Access	No Access

User activity against all Safe In/Safe Out and document maintenance should be logged against the performing role for audit purposes.

9. Documents Categorization:
Here is the list of documents:

Charge and Security
